

Some Potentially Useful Formulas and Definitions

- $\text{proportion} = \frac{\text{number of favorable outcomes}}{\text{total number of outcomes}}$
 - $\text{mean} = \frac{\text{sum of all elements}}{\text{total number of elements}}$
 - To calculate the median:
 1. Line up the numbers in ascending order
 2. Cross off the first and last numbers
 3. Cross off the first and last numbers that haven't been crossed off yet
 4. Continue until there are either two numbers left uncrossed (in which case the median is the mean of the two uncrossed numbers) or there is only one number left uncrossed (in which case that number is the median)
 - $\text{IQR} = Q_3 - Q_1$
 - The SD is a typical distance (in absolute value) between the data values and the mean of the distribution.
